

Introduction to Smart eHealth and eCare Technologies (Devices, Circuits, and Systems)

The demographics and lack of resources in the health and well-being industry are increasingly forcing us to find alternative solutions for individualized health and social care. Smart technologies provide enormous potential in solving this challenge. This book enhances communication between two different fields: technology vs. health and social care. It provides information to people working in health and care about various technological advances. Furthermore, it provides vital information to technology developers about the real needs for technology, as well as the requirements which need to be taken into account. Hence, it is useful for engineers developing well-being related systems, software, or devices that can be used by professionals working with people with specialist needs, well-being and health service providers, educators teaching related courses, and upper level undergraduate students and graduate student studying related topics. The technology focus of the book is widespread and concerns not only elderly care and hospitals, but solutions for various user groups, devices, and technologies whose potential is not fully realized. In addition to nurses and people working in care sector, the book is also meant to give guidelines for engineers to develop person-centered systems by covering such areas as integration of these technologies into service systems and providing information about the needs and requirements for the technology.

Introduction to Smart eHealth and eCare Technologies (Devices Compre Introduction to Smart eHealth and eCare Technologies (Devices, Circuits, and Systems) de Sari Merilampi, Andrew Sirkka na .
