

Mass Extinction: Examining the Current Crisis (Discovery! (Hardcover))

Our understanding of mass extinction of our planets species is right now where our understanding of global climate change was a few years ago: Weve amassed just about enough data to document that we are in fact, not just maybe, but well into the sixth great mass extinction in our planets history; that unlike previous extinction crises, human activities are driving this one; and that its quite clear what needs to be done to change course but not at all clear that doing so will be enough to prevent the loss of half or more of Earths species.
