

An Assessment Of The Department of Defense Strategy For Operating In Cyberspace

In some ways, the cyber domain is quite different from the traditional operational domains of air, land, sea, and space. Cyber threats are stealthy and difficult to attribute; critical infrastructures are difficult to defend against unseen and unpredictable adversaries. The 2011 Department of Defense (DoD) Strategy for Operating in Cyberspace was a significant policy statement for publicly embracing cyberspace as an operational domain and declaring a number of strategic initiatives to maintain U.S. security in the face of emerging cyber threats. In this monograph, Dr. Thomas Chen explains the strategies as they have evolved from previous national strategies and examines each strategy critically for clarity, comprehensiveness, and novelty.
